Features for **practices and smaller clinics**

Tele-medicine

Video and chat functions offer doctors a simple and cost-effective alternative to seeing the patient in their practice. Patients with limited mobility in particular benefit from the possibility of ad-hoc consultation by the doctor - without having to leave their home. This aspect can play a vital role for both doctors and patients in rural areas. Because knowing that the doctor's advice is just a click or two away can give patients in more remote regions a considerable feeling of security and care.

Appointment & Waiting Room Management
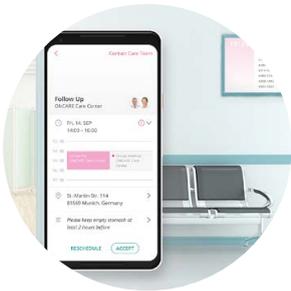

Appointment & Waiting Room Management helps practice or clinic staff to co-ordinate appointments quickly and easily. Via messenger tools, the doctor can send an appointment to his patient, who in turn can confirm (scheduled) or reject (re-scheduling) it with just one click. This not only saves the practice staff costs but also valuable time which previously had to be spent coordinating appointments by telephone. Especially in smaller clinics but also in doctor's practices the waiting time can be reduced considerably because double appointments are excluded. Via a secure HL7 interface, several calendars can also be linked together. This simplifies both the cooperation between wards in hospitals and the appointment manage-ment in practice or clinic networks.

Anamnesis Questionnaire

The electronic Anamnesis Questionnaire with 24/7 editing function for the patient ensures an efficient and thus more cost-effective workflow. Furthermore, efficien-cy in this context stands for better care and more time with the patient. Upon the patient's arrival the doctor is kept up to date about the health status and current condition thanks to automatic notification and thus has more time for diagnosis and/or treatment. Since the patient's details are also saved automatically, the administra-tive effort for doctors as well as practice and clinic staff is significantly reduced.

Medication Plan

With the Medication Plan feature, the doctor can send his patient customized ICD-10-based medication plans and edit them if necessary. A reminder function for regular medication intake and adherence checks is an essential safety tool for both patient and doctor. Possible incompatibilities can be quickly checked and identified thanks to the integrated medication formulations.

The Medication Plan feature is ideally complemented by ePrescription (optional). It is an efficient and cost-saving way for both doctors as well as practice and clinic staff to prescribe drugs. With ePrescription, the prescription is simply generated digitally and sent to the patient – without an appointment in the practice or clinic.
